De Wind et al. The role of ability, motivation and opportunity to work in the transition from work to early retirement – Testing and optimizing the Early Retirement Model
Background
Due to the aging of the population, there is a societal need for workers to prolong their working lives. In the Netherlands, many employees still leave the workforce before the official retirement age of 65. Previous quantitative research showed that poor self-perceived health is a risk factor of (non-disability) early retirement. However, little is known on how poor health may lead to early retirement, and why poor health leads to early retirement in some employees, but not in others. Therefore, the present qualitative study aims to identify in which ways health influences early retirement.

Methods
Face-to-face semi-structured interviews were conducted with 30 employees (60-64 years) who retired before the official retirement age of 65. Participants were selected from the Study on Transitions in Employment, Ability and Motivation. The interviews were transcribed verbatim, a summary was made including a timeline, and the interviews were open coded.

Results
In 15 of the 30 persons, health played a role in early retirement. Both poor and good health influenced early retirement. For poor health, four pathways were identified. First, employees felt unable to work at all due to health problems. Second, health problems resulted in a self-perceived (future) decline in the ability to work, and employees chose to retire early. Third, employees with health problems were afraid of a further decline in health, and chose to retire early. Fourth, employees with poor health retired early because they felt pushed out by their employer, although they themselves did not experience a reduced work ability. A good health influenced early retirement, since persons wanted to enjoy life while their health still allowed to do so. The financial opportunity to retire sometimes triggered the influence of poor health on early retirement, and often triggered the influence of good health. Employees and employers barely discussed opportunities to prolong working life.

Conclusions
Poor and good health influence early retirement via several different pathways. To prolong working life, a dialogue between employers and employees and tailored work-related interventions may be helpful.

**Abstract**
Een longitudinale studie met een follow-up van één jaar onder oudere werknemers laat zien dat psychosociale werkkenmerken van invloed zijn op vervroegde uitstroom uit werk via arbeidsongeschiktheid, werkloosheid en vroegg-pensioen. Fysieke belasting heeft geen invloed op deze routes van vervroegde uitstroom uit werk.

**Objectives:** This study aimed to investigate the relative contribution of health, job characteristics, skills and knowledge, and social and financial factors to the transition from work to (non-disability) early retirement.

**Methods:** Employees aged 59-63 years (N=2317) were selected from the Study on Transitions in Employment, Ability and Motivation in the Netherlands (STREAM). Individual characteristics, health, job characteristics, skills and knowledge, and social and financial factors were measured using a questionnaire at baseline. Information on early retirement was derived from the one-year follow-up questionnaire. Logistic regression analyses were used to identify predictors of early retirement. Population Attributable Fractions (PAF) were calculated.

**Results:** Older age [odds ratio (OR) 1.79], poor physical health (OR 1.78), a positive attitude of the partner with respect to early retirement (OR 3.85), and the financial possibility to stop working before the age of 65 (OR 10.2) predicted the transition to early retirement, whereas employees that reported high appreciation at work (OR 0.58) and higher focus on development of skills and knowledge (OR 0.54) were less likely to retire early. PAF were 0.75 for the financial possibility to stop working, 0.43 for a positive attitude of the partner with respect to early retirement, 0.27 for low appreciation at work, 0.23 for a low focus on development, and 0.21 for poor health.

**Conclusions:** The financial possibility to stop working before the age of 65 importantly contributes to early retirement. In the context of rapidly diminishing financial opportunities to retire early in the Netherlands, the prolongation of working life might be promoted by workplace health promotion and disability management, and work-related interventions focusing on appreciation and the learning environment.

**Abstract**
**Purpose** The goal of this qualitative study was to gain insight into how older employees remain productive at work in spite of health problems.

**Methods** Twenty-six semi-structured telephone interviews were conducted with older employees, 46–63 years of age, who reported a poor health in the Study on Transitions in Employment, Ability, and Motivation. Demographic, health, and work information was gathered, followed by information on adjustments made in
response to health problems. Inductive and deductive analyses were done independently by two researchers.

**Results**
Four pathways through which poor health could influence productivity were identified: (1) poor health did not influence productivity; (2) poor health created a temporary imbalance in demands and external and internal resources after which adjustments were made and productivity was maintained; (3) adjustments were made in response to an imbalance, but productivity remained reduced; and (4) no adjustments were made and productivity was reduced. Whether and which adjustments occurred was influenced by factors in various domains, such as: visibility of the problem (health), autonomy (work-related), support (relational), and the ability to ask for help (personal). Sustainable productivity was influenced by internal factors that enhanced or hindered the creation of a balance, and by whether appropriate adjustments were made.

**Conclusions**
The influence that health can have on productivity depends on the individuals’ unique imbalance and personal disposition. Helpful a priori work place characteristics and personal well-being should be promoted so that a balance between demands and resources can be found in times of poor health.

**Abstract**

**Objectives**
The aim of this study was to (i) assess how common chronic health problems and work-related factors predict sickness absence and (ii) explore whether work-related factors modify the effects of health problems on sickness absence.

**Methods**
A one-year longitudinal study was conducted among employed persons aged 45-64 years from the Study on Transitions in Employment, Ability and Motivation (N=8984). The presence of common chronic health problems and work-related factors was determined at baseline and self-reported sickness absence at one-year follow-up by questionnaire. Multinomial multivariate logistic regression analyses were conducted to assess associations between health, work factors, and sickness absence, and relative excess risk due to interaction (RERI) techniques were used to test effect modification.

**Results**
Common health problems were related to follow-up sickness absence, most strongly to high cumulative sickness absence (>9 days per year). Baseline psychological health problems were strongly related to high sickness absence at follow-up [odds ratio (OR) 3.67, 95% confidence interval (95% CI) 2.80-4.82]. Higher job demands at baseline increased the likelihood of high sickness absence at follow-up among workers with severe headaches [RERI 1.35 (95% CI 0.45-2.25)] and psychological health problems [RERI 3.51 (95% CI 0.67-6.34)] at baseline. Lower autonomy at baseline increased the likelihood of high sickness absence at follow-up among those with musculoskeletal [RERI 0.57 (95% CI 0.05-1.08)], circulatory [RERI 0.82 (95% CI 0.00-1.63)], and psychological health problems [RERI 2.94 (95% CI 0.17-5.70)] at baseline.

**Conclusions**
Lower autonomy and higher job demands increased the association of an array of common chronic health problems with sickness absence, and thus focus should be placed on altering these factors in order to reduce sickness absence and essentially promote sustainable employability.

Abstract
Purpose - This study aims to provide the following empirical and theoretical contributions to the literature. First, the study provides an empirical test of theories proposed in the literature stating that turnover and retirement (two kinds of work withdrawal) involve different employee decisions. Second, it aims at providing a more general theoretical framework understanding turnover and retirement intentions integrating insights from different theories.

Design/methodology/approach - Research hypotheses are tested using the Study on Transitions in Employment, Ability and Motivation (STREAM). This dataset includes information from approximately 15,000 respondents in the Netherlands. Respondents between the age of 45 and 64 were the target group in order to model transitions in the labour market for older workers. This dataset provides a unique opportunity to test turnover and retirement intentions.

Findings - First, the results show that personal characteristics such as income, age or health add more to the explanation of retirement intentions compared to turnover intentions and that work characteristics provide a better explanation of the turnover intention compared to retirement intention. Secondly, by focusing more closely on retirement intentions, the results show that organizational motivators can increase older workers labour market participation.

Background
Due to the aging of the population and, subsequently, higher pressure on public finances, there is a need for employees in many European countries to extend their working lives. Factors predicting early retirement have been identified in quantitative research, but little is known on why and how these factors influence early retirement. Therefore, the present quantitative study aimed to explore which factors influence retirement before the age of 65 in Dutch employees, and why and how these factors influence early retirement. Focus was on non-health related factors.

Methods
A qualitative study among 30 employees (60-64 years) who retired before the age of 65 was performed by means of face-to-face interviews. Participants were selected from the Study on Transitions in Employment, Ability and Motivation (STREAM).

Results
For most employees, a combination of factors played a role in the transition from work to early retirement, and the specific factors involved differed between individuals. Participants reported various factors that pushed towards early retirement (‘push factors’), including organizational changes at work, conflicts at work, high work pressure, high physical job demands, and insufficient use of their skills and knowledge by others in the organization. Employees who reported such push factors towards early retirement often felt unable to find
another job. Factors attracting towards early retirement ('pull factors') included the wish to do other things outside of work, enjoy life, have more flexibility, spend more time with a spouse or grandchildren, and care for others. In addition, the financial opportunity to retire early played an important role. Factors influenced early retirement via changes in the motivation, ability and opportunity to continue working or retire early.

**Conclusion**
To support the prolongation of working life, it seems important to improve the fit between the physical and psychosocial job characteristics on the one hand, and the abilities and wishes of the employee on the other hand. Alongside improvements in the work environment that enable and motivate employees to prolong their careers, a continuous dialogue between the employer and employee on the (future) person-job fit and tailored interventions might be helpful.

**Abstract**
Langer doorwerken vormt een belangrijke uitdaging voor laagopgeleide 45-plussers. Verandering van baan is daarbij een zinvolle, soms zelfs noodzakelijke, strategie. Vrijwillige externe mobiliteit is echter onder laagopgeleide 45-plussers zeldzaam. In deze bijdrage staat de vraag centraal of de versterking van vertrouwen in eigen kunnen (self-efficacy) bij het vinden van een nieuwe werkgever een aangrijpingspunt is voor bevordering van vrijwillige externe mobiliteit onder laagopgeleide 45- tot 64-jarige werknemers. Om de vraag te beantwoorden gebruiken we data van 11.987 werknemers van 45 tot 64 jaar, van wie er 3.212 laagopgeleid zijn. De data zijn afkomstig van de Study on Transitions in Employment, Ability and Motivation (STREAM). Uit het onderzoek blijkt dat vertrouwen in eigen kunnen een positief verband heeft met zowel de intentie tot baanverandering als met daadwerkelijke baanverandering. Hoger opgeleide 45-plussers blijken hoger te scoren op zowel vertrouwen in eigen kunnen als op intentie tot baanverandering. De relatie tussen beide concepten verschilt echter niet tussen laag- en hoger opgeleiden. Deze bevinding impliceert dat versterking van het vertrouwen bij laagopgeleide 45-plussers in een succesvolle baan-баantransitie kan leiden tot een versterking van de vrijwillige externe mobiliteit. Een belangrijke vervolgvraag is dan of die mobiliteit ook tot een minder kwetsbare arbeidsmarktpositie leidt.

**Abstract**
**Objective:** This study examines whether mental and physical health relate differently to work ability and whether these associations vary with coping style.

**Methods:** A 1-year longitudinal study was conducted among 8842 employees aged 45 to 64 years from the
Study on Transitions in Employment, Ability and Motivation. On-line questionnaires measured self-perceived mental and physical health at baseline and coping and work ability at follow-up. The data were analyzed using hierarchical regression analysis.

**Results:** Active coping and good mental and especially physical health predicted high work ability at follow-up. Avoidant coping was negatively related to work ability. Seeking support was unrelated to work ability. Interaction effects of coping and health on work ability were weak.

**Conclusions:** Successful coping styles and good health predict high work ability, and thus, promoting such factors can help improve sustainable employability.

**Abstract**

**Aims:** The objective of the Study on Transitions in Employment, Ability and Motivation (STREAM) is to acquire knowledge on determinants of transitions in employment and work productivity among persons aged 45-64 years.

**Research framework:** A research framework was developed, in which transitions in employment (e.g. leaving the workforce, entering the workforce, job change) and work productivity are influenced by the following determinants: health, job characteristics, skills and knowledge, social factors, and financial factors. Central explanatory variables in the framework are the ability to work, the motivation to work, and the opportunity to work.

**Study Design:** STREAM is a prospective cohort study among 12,055 employees, 1,029 self-employed persons, and 2,034 non-working persons, all aged 45 to 64 years at baseline. The study sample was stratified by age and employment status (employed, self-employed, non-working), and was drawn from an existing internet panel. The baseline measurement was carried out in 2010 (response: 70%), and with yearly follow-up measurements in 2011 (response: 82%), 2012 (response: 80%), and 2013. At each wave, participants fill out an online questionnaire covering all aspects of the research framework.

**Place and Duration of Study:** The Netherlands, between October 2010 and December 2013.

**Methodology:** Quantitative data on all aspects of the research framework were assessed with an online questionnaire, qualitative data were assessed with interview studies, and the questionnaire data can be linked to register data at Statistics Netherlands for 89% of the participants.

**Results:** Transitions in employment between the first three waves of data among the participants are described.

**Conclusion:** STREAM will provide insight in the determinants of healthy and productive labour participation among persons aged 45 years and older, which will support the development of interventions prolonging working life in good health, while maintaining good work productivity.

Concept-artikelen
Rob Gründemann et al. Werkbehoeften van laagopgeleide werknemers.

In dit artikel worden de volgende onderzoeksvragen bestudeerd:
1. In welke mate zijn werkbehoeften van laagopgeleide werknemers anders dan die van middelbaar en hoogopgeleide werknemers?
2. Op welke wijze veranderen de werkbehoeften van laagopgeleide werknemers met het toenemen van de leeftijd?
3. In welke mate worden werkbehoeften van laagopgeleide oudere werknemers door het werk vervuld?
4. Is het vervullen van de werkbehoeften van laagopgeleide oudere werknemers van invloed op hun werktevredenheid en de bereidheid om langer door te werken?

We beantwoorden deze vragen door een onderzoek in de literatuur en door analyses op een grootschalig databestand van personen van 45 jaar en ouder (STREAM).

Daphne Rohrich et al. The association between health, work ability and unpaid work with the intention to start working in paid employment

**Purpose**
To investigate the association between health, work ability and unpaid work with the intention to start working in paid employment in different groups of non-working older persons.

**Methods**
In this cross-sectional study, 1,975 persons aged 45-64 years who participated in the Study on Transitions in Employment, Ability and Motivation (STREAM) were included. Participants were classified as unemployed, retired, housewife/husband or work disabled. Demographics, vitality, work ability, unpaid work (charity work, informal care, looking after others’ children), years since the last job, financial information and the intention to start working in paid employment were assessed by questionnaire. Logistic regression analyses were performed stratified by non-working status.

Fenna Leijten et al. The effects of work-related factors and work engagement on mental and physical health: one year follow-up study among older workers

**Abstract**
**Objectives:** The goals of this study were to determine whether work-related factors and work engagement were differently associated with mental and physical health and whether work engagement modified associations between work factors and health.

**Methods:** A one-year longitudinal study with employed persons aged 45 to 64 years was conducted within the Study on Transitions in Employment, Ability, and Motivation (N=8837). With an online questionnaire, work-related psychosocial and physical factors and work engagement were measured at baseline and health,
assessed with the Short Form-12 Health Survey, at baseline and one-year follow-up. General linear regression models (GLM) were used to assess associations of dichotomized work engagement and work factors with standardized continuous scales of mental and physical health (range 11.27-71.80). Interaction terms were tested to assess whether work engagement modified work factor-health associations.

**De Wind et al. The role of ability, motivation and opportunity to work in the transition from work to early retirement – Testing and optimizing the Early Retirement Model**

**Abstract**

**Objectives:** Determinants in the domains health, job characteristics, skills, and social and financial factors may influence early retirement through three central explanatory variables, i.e. the ability, motivation, and opportunity to work. Based on the literature, we created the Early Retirement Model. This study aims to investigate whether data support the Early Retirement Model and how the model could be improved.

**Methods:** Employees aged 58-62 years (N=1,862), who participated in the first three waves of STREAM were included. Determinants were assessed at baseline, central explanatory variables after one year, and early retirement after two years. Structural equation modeling was applied.

**Andere rapportages**

**Ybema JF, Geuskens G, van den Heuvel S. Duurzame inzetbaarheid van ouderen: Resultaten van de eerste meting van STREAM. 2011, TNO**

**Abstract**

In deze notitie richten we ons op bevindingen die een beeld schetsen van de duurzame inzetbaarheid van werknemers, zelfstandigen en niet-werkenden, waarbij we gebruik maken van de eerste meting van STREAM. Daarbij richten we ons op drie pijlers: gezondheid, scholing en vorming en mobiliteit op de arbeidsmarkt. Wat betreft werknemers blijkt dat laagopgeleide en arbeidsgehandicapte werknemers minder goed scoren op een aantal aspecten van duurzame inzetbaarheid, en dat een goede gezondheid en weinig kennisveroudering samenhangen met een hoger werkvermogen, met werken omdat dit plezierig is en met meer de gelegenheid krijgen om te werken. Wat betreft de duurzame inzetbaarheid van zelfstandigen blijkt dat personen die als zelfstandige aan de slag gingen omdat zij een nieuwe uitdaging zochten een positieve selectie vormen van werkenden. Zij zijn vergeleken met werknemers en met zelfstandigen die om andere redenen als zelfstandige gingen werken hoger opgeleid en vitaler. Wat betreft de niet-werkenden blijkt hun werkvermogen sterk samen te hangen met hun vitaliteit. Naast werklozen blijkt ook een deel van de arbeidsongeschikten, gepensioneerden en huisvrouwen gericht te zijn op het verkrijgen van betaalde arbeid.

### Type publicatie
**Van den Heuvel S, Ybema JF, Leijten FRM, De Wind A. Duurzame inzetbaarheid van ouderen: Resultaten van de eerste twee metingen van STREAM. 2012, TNO**

**Abstract**
In deze notitie richten we ons op voorspellers van duurzame inzetbaarheid, waarbij we gebruik maken van de resultaten van de eerste twee metingen van STREAM en van een interviewstudie bij deelnemers aan STREAM. Meer specifiek gaan we na hoe personen met gezondheidsproblemen toch productief kunnen blijven en hoe verzuim voorkomen kan worden. Daarnaast gaan we na wat bepaalt of mensen blijven participeren in arbeid dan wel uitstromen uit arbeid. De belangrijkste bevindingen met betrekking tot het behoud van productiviteit zijn dat positieve werkkenmerken en persoonlijke welzijn gestimuleerd moeten worden voordat er gezondheidsproblemen optreden omdat deze factoren van belang zijn bij het doen van aanpassingen en het vinden van een balans wanneer er wel gezondheidsproblemen aanwezig zijn. Met betrekking tot de invloed van werkkenmerken en gezondheid op ziekteverzuim blijkt dat vooral bij mensen met gezondheidsproblemen het van belang is om goede werkomstandigheden (niet te hoge taakeisen, veel autonomie) te bevorderen. Met betrekking tot werkkenmerken die van invloed zijn op blijvende participatie in het werk blijkt met name een goed sociaal klimaat een bijdrage te leveren. Slechte fisieke en mentale gezondheid zijn belangrijke voorspellers voor de uitstroom naar werkloosheid en arbeidsongeschiktheid. Voor de uitstroom naar vroegpensioen geldt dit alleen voor fysieke gezondheid en speelt de financiële mogelijkheid om met werken te stoppen ook een hele belangrijke rol.
